# Package 'freegroup' 

January 13, 2024

## Type Package

Title The Free Group
Version 1.1-8
Maintainer Robin K. S. Hankin [hankin.robin@gmail.com](mailto:hankin.robin@gmail.com)
Description The free group in R; juxtaposition is represented by a plus. Includes inversion, multiplication by a scalar, group-theoretic power operation, and Tietze forms. To cite the package in publications please use Hankin (2022) [doi:10.48550/ARXIV.2212.05883](doi:10.48550/ARXIV.2212.05883).

Depends methods, plyr, R (>= 3.5.0)
Suggests knitr, rmarkdown, permutations, testhat
LazyData yes
Imports freealg ( $>=1.0-4$ ), magic ( $>=1.5-9$ ), magrittr
VignetteBuilder knitr
License GPL-2
URL https://github.com/RobinHankin/freegroup
BugReports https://github.com/RobinHankin/freegroup/issues
NeedsCompilation no
Author Robin K. S. Hankin [aut, cre] ([https://orcid.org/0000-0001-5982-0415](https://orcid.org/0000-0001-5982-0415))

## Examples

```
p <- rfree(10,6,3)
x <- as.free('x')
p+x
p^x
```

```
    sum(p)
    abelianize(p)
    subsu(p,"ab","z")
    subs(p,a='z')
    discard(p+x,'a')
```

    abelianize Abelianization of free group elements
    
## Description

Function abelianize() returns a word that is equivalent to its argument under assumption of Abelianness. The symbols are placed in alphabetical order.

## Usage

abelianize ( x )
is.abelian(x)

## Arguments

$x \quad$ An object of class free

## Details

Abelianizing a free group element means that the symbols can commute past one another. Abelianization is vectorized.

Function is.abelian() is trivial: it just checks to see whether argument x has its symbols in alphabetical order. It might have been better to call this abelianized().

Package frab presents extensive R-centric functionality for dealing with the free Abelian group. It is much more efficient than this package for Abelian operations, and contains bespoke methods for working with a range of applications such as tables of counts.

## Author(s)

Robin K. S. Hankin

## Examples

```
    x <- as.free("aabAA")
    x
    abelianize(x)
    x <- rfree(10,10,2)
    x
    abelianize(x)
    abelianize(.[rfree(),rfree()])
    p <- free(rbind(rep(1:5,4),rep(1:4,5)))
    p
    abelianize(p)
```

    abs.free Absolute value of a free object
    
## Description

Replaces every term's power with its absolute value

## Usage

\#\# S3 method for class 'free'
abs (x)

## Arguments

X Object of class free

## Details

Replaces every term's power with its absolute value

## Note

The function's name is motivated by the inequality in the examples section.

## Author(s)

Robin K. S. Hankin

## See Also

subs

## Examples

```
abs(abc(-5:5))
a <- rfree(10,4,7)
b <- rfree(10,4,7)
a
abs(a)
## following should all be TRUE:
all(size(abs(a+b)) <= size(abs(a) + abs(b)))
all(total(abs(a+b)) <= total(abs(a) + abs(b)))
all(number(abs(a+b)) <= number(abs(a) + abs(b)))
all(size(a+b) <= size(abs(a) + abs(b)))
all(total(a+b) <= total(abs(a) + abs(b)))
all(number(a+b) <= number(abs(a) + abs(b)))
```

alpha Alphabetical free group elements

## Description

Produces simple vectors of free group elements based on the alphabet

## Usage

alpha(v)
abc (v)

## Arguments

v Vector of integers

## Details

Function alpha() takes an integer i and returns the letter i of the alphabet. Thus alpha(3) returns c. The function is vectorised: alpha( $1: 3$ ) returns abc.

Function $a b c()$ takes an integer i and returns letters 1 to $i$ of the alphabet. Thus abc(4) returns a.b.c.d. The function is vectorised.

Remember that "letters of the alphabet" is just a phrase: above it refers to the default print method which can be changed, see the examples.

## Author(s)

Robin K. S. Hankin

## Examples

```
    alpha(5) # just the single letter 'e'
    abc(5) # product of a,b,c,d,e
    alpha(1:26) # the whole alphabet; c
    all(alpha(1:26) == as.free(letters)) # should be TRUE
    z <- alpha(26) # variable 'z' is symbol 26, aka 'z'.
    abc(1:10) ^ z
    abc(-5:5)
    alpha(-5:5)
    sum(abc(-5:5))
    ## bear in mind that the symbols used are purely for the print method:
    jj <- LETTERS[1:10]
    options(freegroup_symbols = apply(expand.grid(jj,jj),1,paste,collapse=""))
    alpha(c(66,67,68,69)) # sensible output
    options(freegroup_symbols=NULL) # restore to symbols to default letters
    alpha(c(66,67,68,69)) # print method not very helpful now
```

    backwards
        Write free objects backwards
    
## Description

Write free objects in reverse order

## Usage

backwards(x)

## Arguments

x
Object of class free

## Note

Function backwards() is distinct from rev(), see examples.

## Author(s)

Robin K. S. Hankin

## Examples

```
abc(1:5)
backwards(abc(1:5))
rev(abc(1:5))
x <- rfree(10,5)
all(abelianize(x) == abelianize(backwards(x))) # should be TRUE
```

c Concatenation of free objects

## Description

Concatenate free objects together

## Usage

```
## S3 method for class 'free'
c(...)
## S3 method for class 'free'
rep(x, ...)
```

## Arguments

...
In the method for c() , objects to be concatenated. Should all be of the same type
x
In the method for rep(), a free object

## Author(s)

Robin K. S. Hankin

## Examples

(x <- abc(1:3))
( $y<-$ alpha(22:25))
$c(x, y, x, x)$
\#\# NB: compare
$\operatorname{rep}(x, 2)$
$\mathrm{x} * 2$

## Description

Convert character vectors to free objects

## Usage

char_to_matrix(x)

## Arguments

$x \quad$ A character vector

## Details

Function char_to_matrix() gives very basic conversion between character vectors and free objects. Current functionality is limited to strings like "aaabaacd", which would give $a^{3} b a^{2} c d$. It would be nice to take a string like " $\mathrm{a}^{\wedge} 3 \mathrm{~b}^{\wedge}(-3)$ " but this is not yet implemented.
Function char_to_free() is a vectorized version that coerces output to free.

## Note

The function is not particularly robust; for example, passing anything other than letters a-z or A-Z will give possibly undesirable behaviour.

Upper-case letters A-Z are interpreted by char_to_matrix() as the inverse of their corresponding lower-case equivalents. This behaviour is inherited by char_to_free() and as.free(), so that as.free("A") == inverse(as.free("a")).

Function char_to_free() is consistent with the default print options (which are that the symbols are the lowercase letters a-z). If you change the symbols' names, for example options (freegroup_symbols=sample(lette then things can get confusing. The print method does not change the internal representation of a free object, which is a list of integer matrices.

## Author(s)

Robin K. S. Hankin

## See Also

print.free

## Examples

```
    char_to_matrix("aaabcABC")
    rfree(10,3) + as.free('xxxxxxxxxxxx')
    as.free(letters)*7
    all(is.id(as.free(letters) + as.free(LETTERS)))
    as.free('') # identity element
```

    cumsum Cumulative sum
    
## Description

Cumulative sum of free vectors

## Usage

\#\# S3 method for class 'free' cumsum ( $x$ )

## Arguments

$x \quad$ Vector of class free

## Author(s)

Robin K. S. Hankin

## See Also

sum

## Examples

```
abc(1:6)
cumsum(abc(1:6))
x <- rfree(10,2)
cumsum(c(x,-rev(x)))
```

## Description

Functionality to cyclically reduce words and detect conjugacy

## Usage

```
is.cyclically_reduced(a)
as.cyclically_reduced(a)
cyclically_reduce(a)
cyclically_reduce_tietze(p)
is.conjugate_single(u,v)
x %~% y
## S3 method for class 'free'
is.conjugate(x,y)
allconj(x)
```

## Arguments

$a, x, y \quad$ An object of class free
$p, u, v \quad$ Integer vector corresponding to Tietze form of a word

## Details

A free object is cyclically reduced iff every cyclic permutation of the word is reduced. A reduced word is cyclically reduced iff the first letter is not the inverse of the last one. A reduced word is cyclically reduced if the first and last symbol differ (irrespective of power) or, if identical, have powers of opposite sign. For example, abac and abca are cyclically reduced but abca^\{ -1$\}$ is not. Function is.cyclically_reduced() tests for this.
Function as.cyclically_reduced() takes a vector of free objects and returns the elementwise cyclically reduced equivalents. Function cyclically_reduce() is a synonym with better (English) grammar.
The identity is cyclically reduced: it cannot be shortened by a combination of cyclic permutation followed by reduction. This ensures that is.cyclically_reduced(as.cyclically_reduced(x)) is always TRUE. Also, it is clear that the identity should be conjugate to itself.
Two words $a, b$ are conjugate if there exists a $x$ such that $a x=x b$ (or equivalently $a=x^{-1} b x$ ). This is detected by function is.conjugate(). Functions is_conjugate_single() and cyclically_reduce_tietze() are lower-level helper functions.
Function allconj() returns all cyclically reduced words conjugate to its argument.

## Author(s)

Robin K. S. Hankin

## See Also

reduce

## Examples

```
(x <- abc(1:9) - abc(9:1))
as.cyclically_reduced(x)
    a <- rfree(1000,3)
    all(size(as.cyclically_reduced(a)) <= size(a))
    all(total(as.cyclically_reduced(a)) <= total(a))
    all(number(as.cyclically_reduced(a)) <= number(a))
```

$x<-r f r e e(1000,2)$
y <- as.free('ab')
table (conjugate $=(x \% \sim \%)$, equal $=(x==y))$ \# note zero at top right
allconj(as.free('aaaaab'))
allconj(sum(abc(seq_len(3))))
$x<-r f r e e(1,10,8,8)$
all(is.id(allconj(x) + allconj(-x)[shift(rev(seq_len(total(x))))]))
donames Names attributes of free group elements

## Description

Get and set names of free group elements and arithmetic operations

## Usage

donames(f,e1,e2)

## Arguments

f
e1,e2
A vector, typically of class free
Objects of class free, possibly with names

## Details

Function donames () is a low-level helper function that ensures that the result of arithmetic operations such as + and ${ }^{\wedge}$ have the correct names attributes. The behaviour is inherited from that of base::`+`.

## Author(s)

Robin K. S. Hankin

## See Also

Ops.free

## Examples

```
x <- rfree(9,4)
x
names(x) <- letters[1:9]
x
z <- as.free('z')
x + x
x^z
z^x
n <- 1:9
names(n) <- LETTERS[1:9]
x*n
n*x # note different names
```

```
dot-class Class "dot"
```

## Description

The dot object is defined in the freealg package, and imported here, so that idiom like.$[x, y]$ returns the commutator, that is, $x^{\wedge}-1 y^{\wedge}-1 x y$.

## Arguments

x
Object of any class
i,j
elements to commute
... Further arguments to dot_error(), currently ignored

## Value

Always returns an object of the same class as $x y$.

## Author(s)

Robin K. S. Hankin

## Examples

```
    .[as.free("x"), as.free("y")]
    .[abc(1:6),"z"]
    x <- rfree()
    y <- rfree()
    z <- rfree()
    .[x,y] == -x-y+x+y # should be TRUE
    abelianize(.[x,y])
    ## Jacobi identity _not_ satisfied with this definition:
    is.id(.[x,.[y,z]] + .[y,.[z,x]] + .[z,.[x,y]])
    ## But the Hall-Witt identity is:
    all(is.id(.[.[x,-y],z\mp@subsup{]}{^}{\wedge}y+.[.[y,-z],x\mp@subsup{]}{}{\wedge}z + .[.[z,-x],y]^x))
```

    Extract Extract or replace parts of a free group object
    
## Description

Extract or replace subsets of free objects

## Arguments

| $x$ | Object of class free |
| :--- | :--- |
| index | elements to extract or replace |
| value | replacement value |

## Details

These methods (should) work as expected: an object of class free is a list but standard extraction techniques should work.

## Examples

```
(x <- rfree(20,8,8))
x[5:6]
x[1:2] <- -x[11:12]
x[1:5] <- keep(x[1:5],1:3)
```

free Objects of class free

## Description

Generate, and test for, objects of class free

## Usage

free ( $x$ )
as.free(x)
is.free ( x )
list_to_free(x)

## Arguments

x
Function free() needs either a two-row matrix, or a list of two-row matrices; function as.free() attempts to coerce different types of argument before passing to free() (possibly via list_to_free())

## Details

The basic structure of an element of the free group is a two-row matrix. The top row is the symbols ( $1=\mathrm{a}, 2=\mathrm{b}, 3=\mathrm{c}$, etc) and the bottom row is the corresponding power. Thus $a^{2} b a^{-1} c^{9}$ would be

```
> rbind(c(1,2,1,3),c(2,1,-1,9))
    [,1] [,2] [,3] [,4]
[1,] 1 2 1 3
[2,] 2 1 1 -1 
>
```

Function free() needs either a two-row matrix or a list of two-row matrices. It is the only place in the package that sets the class of an objet to free. Function as.free() is a bit more user-friendly and tries a bit harder to do the Right Thing.
The package uses setOldClass("free") for the dot methods.

## Author(s)

Robin K. S. Hankin

## See Also

```
char_to_free
```

## Examples

```
free(rbind(1:5,5:1))
    x <- rfree(10,3)
    x
    x+x
    x-x
    x[1:5]*(1:5)
    as.free(c(4,3,2,2,2))
    as.free("aaaabccccaaaaa")
    as.free(c("a", "A", "abAAA"))
```

    getlet Get letters of a freegroup object
    
## Description

Get the symbols in a freegroup object

## Usage

getlet(x)

## Arguments

$x \quad$ Object of class free

## Note

By default, return a list with elements corresponding to the elements of $x$. But, if object $x$ is of length 1 , a vector is returned. The result is sorted for convenience.

## Author(s)

Robin K. S. Hankin

## Examples

```
    (x <- rfree(6,7,3))
    getlet(x)
    as.free(getlet(x))
    identical(as.free(getlet(abc(1:26))), abc(1:26))
```

identity The identity element

## Description

Create and test for the identity element

## Usage

is.id(x)
id(n)
\#\# S3 method for class 'free'
is.id( x )

## Arguments

x
Object of class free
n
Strictly positive integer

## Details

Function id() returns a vector of n free objects, all of which are the identity element. Do not ask what happens if $n=0$.

Function is.id() returns a Boolean indicating whether an element is the identity or not. The identity can also be generated using as. free(0).

## Author(s)

Robin K. S. Hankin

## Examples

```
    id()
    as.free(0) \# convenient R idiom for creating the identity
    \(x\) <- rfree \((10,3)\)
    stopifnot(all( \(\mathrm{x}==\mathrm{x}+\mathrm{as}\). free(0)))
    stopifnot(all(is.id(x-x)))
```

keep Keep or drop symbols

## Description

Keep or drop symbols

## Usage

keep(a, yes)
discard(a, no)

## Arguments

a
yes, no Specification of symbols to either keep (yes) or discard (no), coerced to a free object

## Note

Function keep() needs an explicit return() to prevent it from returning invisibly.
The functions are vectorised in the first argument but not the second.
The second argument-the symbols to keep or discard-is formally a vector of nonnegative integers, but the functions coerce it to a free object. The symbols kept or dropped are the union of the symbols in the elements of the vector. Function discard() was formerly known as drop() but this conflicted with base: : drop().

These functions have nothing in common with APL's take() and drop().

## Author(s)

Robin K. S. Hankin

## Examples

(x <- $\operatorname{rfree}(20,5,8))$

```
keep(x,abc(4)) # keep only symbols a,b,c,d
discard(x,as.free('cde')) # drop symbols c,d,e
keep(x,alpha(3)) # keep only abc
```

## nielsen Outer automorphisms of the free group

## Description

Vectorized functionality to implement outer automorphisms of the free group

## Usage

permsymb_single_X(X,f)
permsymb_single_f(X,f)
permsymb_vec(X,f)
permsymb (X,f)
autosub_lowlevel(M,e,S)
autosub(X,e, S, automorphism_warning=TRUE)

## Arguments

$X, S \quad$ Object of class free
$f \quad$ Permutation function
M Single free group element, in two-row matrix form
e Single element to substitute
automorphism_warning
Boolean, with default TRUE meaning to give a warning if the requested substitution is not an automorphism and FALSE meaning not to give the warning

## Details

In 1924, Nielsen showed that the automorphism group of the free group with basis $\left[x_{1}, \ldots, x_{n}\right]$ is generated by the following four elementary Nielsen transformations:

1. switch $x_{1}$ and $x_{2}$
2. Cyclically permute $x_{1}, x_{2}, \ldots, x_{n}$ to $x_{2}, \ldots, x_{n}, x_{1}$
3. Replace $x_{1}$ with $x_{1}^{-1}$
4. Replace $x_{1}$ with $x_{1} x_{2}$.

The functions documented here give vectorized methods to effect such outer automorphisms, using the permutations package.
Operations 1 and 2 above generate the symmetric group $S_{n}$ and such automorphisms are effected by function permsymb(). Operation 3 is carried out by by flip() and operation 4 by subsymb().

Functions permsymb_single_X(), permsymb_single_f(), permsymb_vec() and subsymb_lowlevel() are low-level helper functions that are not really suited for the end user; use permsymb(), (flip) and subsymb() instead.

## Note

Function permsymb() is intended to work nicely with the permutations package; see inst/outer.Rmd for some illustrations. The function is not perfect.

## Author(s)

Robin K. S. Hankin

autosub(P,"c",as.free("xyz"))
flip(P,"c")
flip(P,"ac")
```

Ops.free Arithmetic Ops methods for the free group

## Description

Allows arithmetic operators to be used for manipulation of free group elements such as addition, multiplication, powers, etc

## Usage

```
\#\# S3 method for class 'free'
Ops(e1, e2)
free_equal(e1,e2)
free_power(e1,e2)
free_repeat(e1,n)
juxtapose(e1,e2)
\#\# S3 method for class 'free'
inverse(e1)
\#\# S3 method for class 'matrix'
inverse(e1)
```

## Arguments

e1, e2
Objects of class free
n
An integer, possibly non-positive

## Details

The function Ops.free() passes binary arithmetic operators ("+", "-", "*", "^", and "==") to the appropriate specialist function.
There are two non-trivial operations: juxtaposition, denoted "a+b", and inversion, denoted "-a". Note that juxtaposition is noncommutative and $a+b$ will not, in general, be equal to $b+a$.
All operations return a reduced word.
The caret, as in $a^{\wedge} b$, denotes group-theoretic exponentiation ( $-b+a+b$ ); the notation is motivated by the identities $x^{\wedge}(y z)=\left(x^{\wedge} y\right)^{\wedge} z$ and $(x y)^{\wedge} z=x^{\wedge} z * y^{\wedge} z$, as in the permutations package.
Multiplication between a free object a and an integer $n$ is defined as juxtaposing $n$ copies of a and reducing. Zero and negative values of $n$ work as expected.

## Note

The package uses additive notation but multiplicative notation might have been better.

## Author(s)

Robin K. S. Hankin

## Examples

```
x <- as.free(c("a","ab","aaab","abacc"))
y <- as.free(c("aa","BA","Bab","aaaaa"))
x
y
```

```
x + y
x + as.free("xyz")
x+y == y+x # not equal in general
x*5 == x+x+x+x+x # always true
x + alpha(26)
x^y
```

print Print free objects

## Description

Print methods for free objects

## Usage

\#\# S3 method for class 'free'
print(x,...)
as.character_free(m,latex=getOption("latex"))

## Arguments

x
m
latex

Object of class free in the print method
A two-row matrix in function as.character_free()
Boolean, with TRUE meaning to print latex-friendly output including curly braces, and default NULL option meaning to give a nicer-looking output that latex would typeset incorrectly
... Further arguments, currently ignored

## Note

The print method does not change the internal representation of a free object, which is a list of integer matrices.
The default print method uses multiplicative notation (powers) which is inconsistent with the juxtaposition method " + ".
The print method has special dispensation for length-zero free objects but these are not handled entirely consistently.
The default print method uses lowercase letters a-z, but it is possible to override this using options("freegroup_symbols" $=f o o$ ), where foo is a character vector. This is desirable if you have more than 26 symbols, because unallocated symbols appear as NA.

The package will allow the user to set options("freegroup_symbols") to unhelpful things like rep("a", 20) without complaining (but don't actually do it, you crazy fool).
reduce

```

    reduce \(\quad\) Reduction of a word to reduced form
    
## Description

Given a word, remove redundant zero-power terms, and consolidate adjacent like terms into a single power

## Usage

reduce (a)
is_reduced(a)
remove_zero_powers(a)
consolidate(a)
is_proper(a)

## Arguments

## Details

A word is reduced if no symbol appears next to its own inverse and no symbol has zero power. The essence of the package is to reduce a word into a reduced form. Thus $a^{2} b^{-1} b a$ will transformed into $a^{3}$.
In the package, reduction happens automatically at creation, in function free().
Apart from is_proper(), the functions all take a free object, but the meat of the function operates on a single two-row matrix.
Reduction is carried out by repeatedly consolidating adjacent terms of identical symbol (function consolidate()), and removing zero power terms (function remove_zero_power()) until the word is in reduced form (function is_reduced()).
Function is_proper () checks to see whether a matrix is suitably formed for passing to reduce().
A free object is cyclically reduced iff every cyclic permutation of the word is reduced. A reduced word is cyclically reduced iff the first letter is not the inverse of the last one. A reduced word is cyclically reduced if the first and last symbol differ (irrespective of power) or, if identical, have powers of opposite sign. For example, abac and abca are cyclically reduced but $a b c a \wedge\{-1\}$ is not. Function is.cyclically.reduced() tests for this, documented at cycred.Rd.

## Examples

```
## create a matrix:
(M <- rbind(c(1,2,3,3,2,3,2,1),c(1,2,3,-3,5,0,7,0)))
## call the print method (note non-reduced form):
as.character_free(M)
## show the effect of reduce():
as.character_free(reduce(M))
## free() calls reduce() automatically:
free(M)
```

rfree Random free objects

## Description

Creates a vector of random free objects. Intended as a quick "get you going" example of free group objects

## Usage

rfree( $\mathrm{n}=7$, size=4, number $=$ size, powers $=$ seq(from $=-$ size, to $=$ size))

## Arguments

$\mathrm{n} \quad$ Length of random vector to generate
size Maximum length of each element
number How many distinct letters to sample from
powers Powers in resulting polynomial. An integer $n$ is interpreted (via sample()) as seq_len(n)

## Details

The auxiliary arguments specify the general complexity of the returned object with small meaning simpler.

size

## Examples

```
rfree()
abelianize(rfree())
rfree(10,2)
rfree(10,30, 26)
rfree(powers=5)
rfree(powers=5:6)
    rfree(20,2)^alpha(26)
```

    shift Permute elements of a vector in a cycle
    
## Description

Given a vector, permute the elements with a cyclic permutation

## Usage

$\operatorname{shift}(x, i=1)$

## Arguments

x
i Integer, number of places to permute. Negative values mean to count from the end

## Details

This function is that of the magic package, where it is motivated and discussed.

## Value

Returns a vector

## Author(s)

Robin K. S. Hankin

## Examples

```
shift(1:9)
shift(1:9,-1)
shift(1:9,2)
```

size Bignesses of a free object

## Description

Various metrics to describe how "big" a free object is

## Usage

size(a)
total(a)
number (a)
bigness(a)

## Arguments

a
Vector of free group objects

## Details

- The size of an object is the number of pure powers in it (this is the number of columns of the matrix representation of the word)
- The total of an object is the sum of the absolute values of its powers
- The number of an object is the number of distinct symbols in it

Thus size $\left(a^{\wedge} 2 b a\right)=3$, total $\left(a^{\wedge} 2 b a\right)=4$, and number $\left(a^{\wedge} 2 b a\right)=2$.
Function bigness () is a convenience wrapper that returns all three bigness measures.

## Value

These functions return an integer vector.

## Note

I would like to thank Murray Jorgensen for his insightful comments which inspired this functionality.

abs

## Examples

```
(a <- rfree(20,6,4))
size(a)
total(a)
number(a)
a <- rfree(20,6,4)
b <- rfree(20,6,4)
## Following should all be TRUE
size(a+b) <= size(a) + size(b)
total(a+b) <= total(a) + total(b)
number(a+b) <= number(a)+ number(b)
bigness(rfree(10,3,3))
bigness(allconj(rfree(1,6,1)))
```

## Description

Substitute and invert specific symbols in a free object

## Usage

subsu( $X$, from, to)
subs (X, ...)
flip(X, turn)

## Arguments

| X | Object of class free |
| :--- | :--- |
| from, to, turn | Objects coerced to class free specifying symbols to alter. These arguments are <br> coerced to symbols using getlet (as.free()) |
| $\ldots$ | Named arguments for substitution |

## Details

Function subsu( $X$, from, to) takes object $X$ and transforms every symbol present in from into the symbol specified in to.
Function flip (X, turn) takes object $X$ and replaces every symbol present in turn with its inverse.
Function discard(), documented at keep.Rd, effectively substitutes a symbol with the identity element (thereby discarding it).
Experimental function subs() is modelled on similar functionality in the freealg package and makes idiom such as $\operatorname{subs}(X, a=' z ')$ work as expected (viz, taking each instance of symbol a and replacing it with x ).

## Note

Functions subs() and subsu() substitute for particular symbols, not free group elements. In particular, be careful with uppercase (inverse) symbols; because the power is discarded, substituing with $x$ is the same as substituting for $X$. This behaviour might change in the future.

```
abs,discard
```

## Examples

```
subsu(abc(1:10),abc(5), 'z')
flip(abc(1:10),abc(5))
o <- rfree(30,5,10)
# Following tests should all be TRUE:
size(flip(o,'a')) == size(o)
number(flip(o,'a')) == number(o)
total(flip(o,'a')) == total(o)
size(subsu(o,'a','b')) <= size(o)
number(subsu(o,'a','b')) <= number(o)
total(subsu(o,'a','b')) <= total(o)
frog <- rfree()
subs(frog,a='x')
```

    sum Repeated summation by concatenation
    
## Description

Concatenates its arguments to give a single free object

## Usage

\#\# S3 method for class 'free'
sum(..., na.rm = FALSE)

## Arguments

| $\ldots$. | Objects of class free, to be summed |
| :--- | :--- |
| na.rm | Boolean, indicating whether to ignore NA entries (currently ignored) |

## Details

Concatenates its arguments and gives a single element of the free group. It works nicely with rev(), see the examples.

## Note

The package uses additive notation, but it is easy to forget this and wonder why idiom like prod(rfree()) does not work as desired. Of course, the package using additive notation means that one probably wants sum(rfree()).

## Author(s)

Robin K. S. Hankin

## Examples

```
(x <- rfree(10,3))
sum(x)
abelianize(sum(x))
(y <- rfree(10,6))
sum(x,y)
sum(x,y) == \operatorname{sum}(\operatorname{sum}(x),\operatorname{sum}(y))
x+y # not the same!
sum(x,-x)
sum(x,\operatorname{rev}(-x))
z <- alpha(26)
stopifnot(sum( (x^z) == sum(x ( ^ z)
```

tietze Tietze form for free group objects

## Description

Translate an object of class free to and from Tietze form

## Usage

```
## S3 method for class 'free'
tietze(x)
## S3 method for class 'matrix'
tietze(x)
vec_to_matrix(x)
```

## Arguments

x
Object to be converted

## Details

The Tietze form for a word is a list of integers corresponding to the symbols of the word; typically $a=1, b=2, c=3, d=4$, etc. Negative integers represent the inverses of the symbols. Thus $c^{\wedge} 4 . d^{\wedge}-2$.a.c becomes $3333-4-413$.
Function vec_to_matrix() is a low-level helper function that returns a two-row integer matrix. If given 0 or NULL, it returns a two-row, zero-column matrix.

## Author(s)

Robin K. S. Hankin

## Examples

```
(x <- rfree(10,3))
tietze(x)
vec_to_matrix(c(1,3,-1,-1,-1,2))
as.free(list(c(1,1,8),c(2,-4,-4)))
all(as.free(tietze(abc(1:30))) == abc(1:30))
```
