

# Package ‘survsup’

May 7, 2019

**Title** Plotting Survival Curves with Numbers at Risk Table

**Version** 0.0.2

**Author** Daniel Lindholm <[daniel.lindholm@me.com](mailto:daniel.lindholm@me.com)>

**Maintainer** Daniel Lindholm <[daniel.lindholm@me.com](mailto:daniel.lindholm@me.com)>

**Description** Implements functions to plot survival curves. Provides the capability to add numbers at risk tables, and allows for using the pipe operator to create more complex plots.

**Depends** R (>= 3.3.0)

**License** GPL-2

**Encoding** UTF-8

**URL** <http://github.com/dlindholm/survsup>

**BugReports** <http://github.com/dlindholm/survsup/issues>

**LazyData** true

**Imports** stats, utils, survival, dplyr, ggplot2, broom, colorspace, gridExtra

**RoxxygenNote** 6.1.1

**Suggests** knitr, rmarkdown

**VignetteBuilder** knitr

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2019-05-07 07:40:03 UTC

cat4

*Convenience function for four-category color scheme***Description**

Convenience function to change the color scheme to four colors: Green, blue, red, and yellow; i.e. like the ski slopes but with yellow instead of black.

**Usage**

```
cat4(g, reverse = FALSE)
```

**Arguments**

g	ggplot object containing a Kaplan-Meier plot
reverse	should the order of the colors be reversed?

**Value**

Returns a ggplot object

**Author(s)**

Daniel Lindholm

**Examples**

```
library(survival)
library(dplyr)
veteran %>%
  survfit(Surv(time, status) ~ celltype, data = .) %>%
  plot_survfit(cuminc = FALSE) %>%
  cat4(reverse = TRUE)
```

hcl\_rainbow

*Convenience function for the rainbow\_hcl color scheme***Description**

Convenience function to change the color scheme to the rainbow\_hcl scheme provided by the colorspace package. The function will detect how many strata are available and will pick that many colors from rainbow\_hcl.

**Usage**

```
hcl_rainbow(g, reverse = FALSE, c = 50, l = 70, start = 0,
            end = 360 * (n - 1)/n)
```

**Arguments**

<code>g</code>	ggplot object containing a Kaplan-Meier plot
<code>reverse</code>	should the order of the colors be reversed?
<code>c</code>	chroma
<code>l</code>	luminance
<code>start</code>	the hue at which the rainbow begins
<code>end</code>	the hue at which the rainbow ends

**Value**

Returns a ggplot object

**Author(s)**

Daniel Lindholm

**Examples**

```
library(survival)
library(dplyr)
veteran %>%
  survfit(Surv(time, status) ~ celltype, data = .) %>%
  plot_survfit(cuminc = FALSE) %>%
  hcl_rainbow()
```

`nar`

*Add a numbers at risk table to a Kaplan-Meier plot*

**Description**

Creates a numbers at risk table based on a ggplot object created by the plot\_survfit function. It will add a table in the lower part of the plot, with numbers where the X axis tick marks are situated.

**Usage**

```
nar(g, size = NA, x_offset = 0.02, y_offset = 0.05,
  forced_height = NULL, flip = FALSE, separator = TRUE,
  sep_lwd = 0.2, sep_color = "grey70")
```

**Arguments**

<code>g</code>	a ggplot object to which a numbers at risk table should be added.
<code>size</code>	a numeric value indicating the font size of the NAR table
<code>x_offset</code>	a constant indicating how much padding should be placed to the left of the NAR table (a multiple of the plot size in the X dimension)

<code>y_offset</code>	a constant indicating how much each line in the NAR table should be offset (as a multiple of both the plotting space size and the row number)
<code>forced_height</code>	a constant that, if provided, will force the NAR table to be of a certain height. This represents a multiple of the plot size in the Y dimension. This overrides the <code>y_offset</code> setting. Useful when you wish to plot multiple plots along side each other where the number of strata differs, as this setting will ensure that the sizes of the NAR tables are constant.
<code>flip</code>	a logical scalar indicating whether the order in rows of the NAR table should be flipped or not.
<code>separator</code>	a logical scalar indicating whether a line that separates the plot from the NAR table should be put in place
<code>sep_lwd</code>	what width should that line have?
<code>sep_color</code>	which color should we use for that line?

### Value

Returns a ggplot object

### Author(s)

Daniel Lindholm

### Examples

```
library(survsup); library(ggplot2); library(dplyr); library(survival)

retinopathy %>%
  survfit(Surv(futime, status) ~ trt, data = .) %>%
  plot_survfit() %>%
  nar()

# Without table flip:
flchain %>%
  survfit(Surv(futime, death) ~ sex, data = .) %>%
  plot_survfit(cuminc = FALSE) %>%
  nar()

# With table flip:
flchain %>%
  survfit(Surv(futime, death) ~ sex, data = .) %>%
  plot_survfit(cuminc = FALSE) %>%
  nar(flip = TRUE)
```

---

**plot\_survfit***Plot a survfit object*

---

## Description

Creates a Kaplan-Meier plot based on a survfit object

## Usage

```
plot_survfit(fit, lwd = 1, xmax = NULL, xbreaks = NULL,  
            ylim = NULL, ci = FALSE, cuminc = TRUE, y_percent = TRUE,  
            split_legend_labels = TRUE, legend.title = NA,  
            legend.position = "top")
```

## Arguments

fit	A survfit object that we should plot
lwd	Line width
xmax	What is the upper limit of the X axis? The default will plot all data.
xbreaks	A numeric vector. Where should the breaks in the X axis be? The default will give ggplot's default breaks.
ylim	A numeric vector of length 2. Which are the Y axis limits?
ci	A logical scalar. Should confidence intervals be plotted?
cuminc	A logical scalar. Should cumulative incidence be plotted (default), or should be survival be plotted instead (cuminc = FALSE)?
y_percent	A logical scalar. Should the Y axis display percentages?
split_legend_labels	A logical scalar. Should the legends labels be split, i.e. removing the "<variable_name>=" for each stratum?
legend.title	What title should the legend have? By default it will take the value that was split if split_legend_labels was used; otherwise it will take the value "strata"
legend.position	Where should the legend be drawn? Possible answers are: "top", "bottom", "left", "right"; or if you want to skip putting a legend on the plot: "none"

## Value

Returns a ggplot object

## Author(s)

Daniel Lindholm

## Examples

```
library(survsup); library(ggplot2); library(dplyr); library(survival)

retinopathy %>%
  survfit(Surv(futime, status) ~ trt, data = .) %>%
  plot_survfit()

retinopathy %>%
  survfit(Surv(futime, status) ~ trt, data = .) %>%
  plot_survfit(ci = TRUE, cuminc = FALSE)

# Since a ggplot object is returned,
# you can tweak as you wish
# (in this case with multiple labels):
mgus2 %>%
  survfit(Surv(futime, death) ~ sex, data = .) %>%
  plot_survfit(cuminc = FALSE) %>%
  nar(flip = TRUE) %>%
  hcl_rainbow()+ # <--- Notice + sign here!
  labs(title = "This is an excessively long title",
       subtitle = "This is a subtitle",
       x = "Time (days)",
       y = "Survival (%)",
       caption = "(This is a demo)")
```

*skislopes*

*Convenience function for skislope color scheme*

## Description

Convenience function to change the color scheme to four colors: Green, blue, red, and black; i.e. as ski slopes are classified.

## Usage

```
skislopes(g, reverse = FALSE)
```

## Arguments

<code>g</code>	ggplot object containing a Kaplan-Meier plot
<code>reverse</code>	should the order of the colors be reversed?

## Value

Returns a ggplot object

**Author(s)**

Daniel Lindholm

**Examples**

```
## Not run:  
library(survival)  
library(dplyr)  
veteran %>%  
  survfit(Surv(time, status) ~ celltype, data = .) %>%  
  plot_survfit(cuminc = FALSE) %>%  
  skislopes(reverse = TRUE)  
  
## End(Not run)
```

---

theme\_km

*Custom ggplot theme that make Kaplan-Meier curves look nice*

---

**Description**

Custom theme, based upon the theme\_bw theme in ggplot2

**Usage**

```
theme_km(base_size = 11, base_family = "",  
         base_line_size = base_size/22, base_rect_size = base_size/22)
```

**Arguments**

base\_size      base font size  
base\_family     base font family  
base\_line\_size  base size for line elements  
base\_rect\_size  base size for rect elements

**Examples**

```
library(survsup); library(ggplot2)  
p <- ggplot(mtcars) + geom_point(aes(x = wt, y = mpg,  
                                     colour = factor(gear))) + facet_wrap(~am)  
  
p + theme_km()
```
