Package 'webdriver'

October 12, 2022
Title 'WebDriver' Client for 'PhantomJS'
Version 1.0.6
Author Ariya Hidayat, Gábor Csárdi, Gabor Torok, Ivan De Marino, Robert Gieseke, Steven Masala, Winston Chang, Zack Weinberg
Maintainer Gábor Csárdi <csardi.gabor@gmail.com></csardi.gabor@gmail.com>
Description A client for the 'WebDriver' 'API'. It allows driving a (probably headless) web browser, and can be used to test web applications, including 'Shiny' apps. In theory it works with any 'WebDriver' implementation, but it was only tested with 'PhantomJS'.

2 Element

Index 11

Element HTML element

Description

HTML element

Usage

```
e <- s$findElement(css = NULL, linkText = NULL,
    partialLinkText = NULL, xpath = NULL)
e$findElement(css = NULL, linkText = NULL,
    partialLinkText = NULL, xpath = NULL)
e$findElements(css = NULL, linkText = NULL,
    partialLinkText = NULL, xpath = NULL)
e$isSelected()
e$getValue()
e$setValue(value)
e$getAttribute(name)
e$getClass()
e$getCssValue(name)
e$getText()
e$getName()
e$getData(name)
e$getRect()
e$isEnabled()
e$click()
e$clear()
e$sendKeys(...)
e$moveMouseTo(xoffset = NULL, yoffset = NULL)
e$executeScript(script, ...)
e$executeScriptAsync(script, ...)
```

Arguments

```
e An Element object.
```

s A Session object.

css Css selector to find an HTML element.

linkText Find <a> HTML elements based on their innerText.

partialLinkText Find <a> HTML elements based on their innerText. It uses partial matching.

xpath Find HTML elements using XPath expressions.

Element 3

name String scalar, named of attribute, property or css key. For getData, the key of the data attribute.

xoffset Horizontal offset for mouse movement, relative to the position of the element. If at least of of xoffset and yoffset is NULL, then they are ignored.

yoffset Vertical offset for mouse movement, relative to the position of the element. If at least of of xoffset and yoffset is NULL, then they are ignored.

value Value to set, a character string.

... For sendKeys the keys to send, see key. For executeScript and executeScriptAsync argument to supply to the script.

Details

To create Element objects, you need to use the findElement (or findElement) method of a Session object.

e\$findElement() finds the *next* HTML element from the current one. You need to specify one of the css, linkText, partialLinkText and xpath arguments. It returns a new Element object.

e\$findElements() finds all matching HTML elements starting from the current element. You need to specify one of the css, linkText, partialLinkText and xpath arguments. It returns a list of newly created Element objects.

e\$isSelected() returns TRUE is the element is currently selected, and FALSE otherwise.

e\$getValue() returns the value of an input element, it is a shorthand for e\$getAttribute("value").

e\$setValue() sets the value of an input element, it is essentially equivalent to sending keys via e\$sendKeys().

 ${\tt e\$getAttribute()}\ queries\ an\ arbitrary\ HTML\ attribute.\ It\ is\ does\ not\ exist,\ {\tt NULL}\ is\ returned.$

e\$getClass() uses e\$getAttribute to parse the 'class' attribute into a character vector.

e\$getCssValue() queries a CSS property of an element.

e\$getText() returns the innerText on an element.

e\$getName() returns the tag name of an element.

e\$getData() is a shorthand for querying data-* attributes.

e\$getRect() returns the 'rectangle' of an element. It is named list with components x, y, height and width.

e\$isEnabled() returns TRUE if the element is enabled, FALSE otherwise.

e\$click() scrolls the element into view, and clicks the in-view centre point of it.

e\$clear() scrolls the element into view, and then attempts to clear its value, checkedness or text content.

e\$sendKeys() scrolls the form control element into view, and sends the provided keys to it. See key for a list of special keys that can be sent.

e\$uploadFile() uploads a file to a <input type="file"> element. The filename argument can contain a single filename, or multiple filenames, for file inputs that can take multiple files.

e\$moveMouseTo() moves the mouse cursor to the element, with the specified offsets. If one or both offsets are NULL, then it places the cursor on the center of the element. If the element is not on the screen, then is scrolls it into the screen first.

4 install_phantomjs

esexecuteScript() and esexecuteScriptAsync() call the method of the same name on the Session object. The first argument of the script (arguments[0]) will always hold the element object itself.

install_phantomjs

Install PhantomJS

Description

Download the zip package, unzip it, and copy the executable to a system directory in which **web-driver** can look for the PhantomJS executable.

Usage

```
install_phantomjs(version = "2.1.1",
  baseURL = "https://github.com/wch/webshot/releases/download/v0.3.1/")
```

Arguments

version The version number of PhantomJS.

baseURL The base URL for the location of PhantomJS binaries for download. If the

default download site is unavailable, you may specify an alternative mirror, such

as "https://bitbucket.org/ariya/phantomjs/downloads/".

Details

This function was designed primarily to help Windows users since it is cumbersome to modify the PATH variable. Mac OS X users may install PhantomJS via Homebrew. If you download the package from the PhantomJS website instead, please make sure the executable can be found via the PATH variable.

On Windows, the directory specified by the environment variable APPDATA is used to store 'phantomjs.exe'. On OS X, the directory '~/Library/Application Support' is used. On other platforms (such as Linux), the directory '~/bin' is used. If these directories are not writable, the directory 'PhantomJS' under the installation directory of the **webdriver** package will be tried. If this directory still fails, you will have to install PhantomJS by yourself.

Value

NULL (the executable is written to a system directory).

key 5

key

Special keys, so that we can refer to them with an easier syntax

Description

Special keys, so that we can refer to them with an easier syntax

Usage

key

Format

An object of class list of length 51.

Examples

```
## Not run:
el$sendKeys("xyz")
el$sendKeys("x", "y", "z")
el$sendKeys("username", key$enter, "password", key$enter)

## Sending CTRL+A
el$sendKeys(key$control, "a")

## Note that modifier keys (control, alt, shift, meta) are sticky,
## they remain in effect in the rest of the sendKeys() call. E.g.
## this sends CTRL+X and CTRL+S
el$sendKeys(key$control, "x", "s")

## You will need multiple calls to release control and send CTRL+X S
el$sendKeys(key$control, "x")
el$sendKeys("s")

## End(Not run)
```

run_phantomjs

Start up phantomjs on localhost, and a random port

Description

Throws and error if phantom cannot be found, or cannot be started. It works with a timeout of five seconds.

6 Session

Usage

```
run_phantomjs(debugLevel = c("INFO", "ERROR", "WARN", "DEBUG"),
  timeout = 5000)
```

Arguments

debugLevel Phantom.js debug level, possible values: "INFO", "ERROR", "WARN", "DEBUG".

timeout How long to wait (in milliseconds) for the webdriver connection to be established to the phantomjs process.

Value

A list of process, the callr::process object, and port, the local port where phantom is running.

Session

WebDriver session

Description

Drive a headless phantom.js browser via the WebDriver protocol. It needs phantom.js running in WebDriver mode.

Usage

```
s \leftarrow Session + (host = "127.0.0.1", port = 8910)
s$delete()
s$status()
s$go(url)
s$getUrl()
s$goBack()
s$goForward()
s$refresh()
s$getTitle()
s$getSource()
s$takeScreenshot(file = NULL)
s$findElement(css = NULL, linkText = NULL,
    partialLinkText = NULL, xpath = NULL)
s$findElements(css = NULL, linkText = NULL,
    partialLinkText = NULL, xpath = NULL)
s$executeScript(script, ...)
s$executeScriptAsync(script, ...)
s$setTimeout(script = NULL, pageLoad = NULL, implicit = NULL)
```

Session 7

```
s\moveMouseTo(xoffset = 0, yoffset = 0)
s\mathbb{click}(button = c("left", "middle", "right"))
s\mathbb{doubleClick}(button = c("left", "middle", "right"))
s\mathbb{mouseButtonDown}(button = c("left", "middle", "right"))
s\mathbb{mouseButtonUp}(button = c("left", "middle", "right"))
s\mathbb{readLog}(type = c("browser", "har"))
s\mathbb{getLogTypes}()
s\mathbb{waitFor}(expr, checkInterval = 100, timeout = 3000)
```

Arguments

s A Session object.

host Host name of phantom.js.

port Port of phantom.js.

url URL to nagivate to.

file File name to save the screenshot to. If NULL, then it will be shown on the R graphics device.

css Css selector to find an HTML element.

linkText Find HTML elements based on their innerText.

partialLinkText Find HTML elements based on their innerText. It uses partial matching.

xpath Find HTML elements using XPath expressions.

script For executeScript and executeScriptAsync. JavaScript code to execute. It will be placed in the body of a function.

... Arguments to the script, they will be put in a list called arguments. Element objects are automatically transformed to DOM element in JavaScript.

script For setTimeout. Script execution timeout, in milliseconds. More below.

pageLoad Page load timeout, in milliseconds. More below.

implicit Implicit wait before calls that find elements, in milliseconds. More below.

xoffset Horizontal offset for mouse movement, relative to the current position.

yoffset Vertical offset for mouse movement, relative to the current position.

button Mouse button. Either one of "left", "middle", "right", or an integer between 1 and 3.

type Log type, a character scalar.

expr A string scalar containing JavaScript code that evaluates to the condition to wait for.

checkInterval How often to check for the condition, in milliseconds.

timeout Timeout for the condition, in milliseconds.

8 Session

Details

Session\$new() creates a new WebDriver session.

s\$delete() deletes a WebDriver session.

s\$status() returns a status message from the server. It is a named list, and contains version numbers and capabilities.

s\$go() navigates to the supplied URL.

s\$getUrl() returns the current URL.

s\$goBack() is like the web browser's back button. It goes back to the previous page.

s\$goForward() is like the web browser's forward button.

s\$refresh() is like the web browser's refresh button.

s\$getTitle() returns the title of the current page.

s\$getSource() returns the complete HTML source of a page, in a character scalar.

s\$takeScreenshot() takes a screenshot of the current page. You can save it to a PNG file with the file argument, or show it on the graphics device (if file is NULL).

s\$findElement() finds a HTML element using a CSS selector, XPath expression, or the innerHTML of the element. If multiple elements match, then the first one is returned. The return value is an Element object.

s\$findElements() finds HTML elements using a CSS selector, XPath expression, or the innerHTML of the element. All matching elements are returned in a list of Element objects.

s\$executeScript() executes JavaScript code. It places the code in the body of a function, and then calls the function with the additional arguments. These can be accessed from the function via the arguments array. Returned DOM elements are automatically converted to Element objects, even if they are inside a list (or list of list, etc.).

s\$executeScriptAsync() is similar, for asynchronous execution. It place the script in a body of a function, and then calls the function with the additional arguments and a callback function as the last argument. The script must call this callback function when it finishes its work. The first argument passed to the callback function is returned. Returned DOM elements are automatically converted to Element objects, even if they are inside a list (or list of list, etc.).

s\$setTimeout() sets various timeouts. The 'script' timeout specifies a time to wait for scripts to run. The sQuotepage load timeout specifies a time to wait for the page loading to complete. The 'implicit' specifies a time to wait for the implicit element location strategy when locating elements. Their defaults are different in the standard and in Phantom.js. In Phantom.js the 'script' and 'page load' timeouts are set to infinity, and the 'implicit' waiting time is 200ms.

s\$moveMouseTo() moves the mouse cursor by the specified offsets.

s\$click() clicks the mouse at its current position, using the specified button.

s\$doubleClick() emulates a double click with the specified mouse button.

s\$button_down() emulates pressing the specified mouse button down (and keeping it down).

s\$button_up() emulates releasing the specified mouse button.

s\$getLogTypes() returns the log types supported by the server, in a character vector.

s\$readLog() returns the log messages since the last readLog call, in a data frame with columns timestamp, level and message.

webdriver 9

s\$waitFor() waits until a JavaScript expression evaluates to true, or a timeout happens. It returns TRUE is the expression evaluated to true, possible after some waiting. If the expression has a syntax error or a runtime error happens, it returns NA.

webdriver

'WebDriver' Client for 'PhantomJS'

Description

A client for the 'WebDriver' 'API'. It allows driving a (probably headless) web browser, and can be used to test web applications, including 'Shiny' apps. In theory it works with any 'WebDriver' implementation, but it was only tested with 'PhantomJS'.

Window

A browser window

Description

A browser window

Usage

```
w <- s$getWindow()
wlist <- s$getAllWindows()

w$close()
w$sisActive()
w$switchTo()
w$maximize()
w$getSize()
w$setSize(width, height)
w$getPosition()
w$setPosition(x, y)</pre>
```

Arguments

```
s A Session object.
```

w A Window object.

wlist A list of Window objects.

width Integer scalar, requested width of the window.

height Integer scalar, requested height of the window.

- x Integer scalar, requested horizontal window position.
- y Integer scalar, requested vertical window position.

10 Window

Details

The getWindow method of a Session object returns the current browser window as a Window object. The getAllWindows method returns a list of window objects, all browser windows.

w\$close() closes the window.

w\$isActive() returns TRUE if the window is active, FALSE otherwise.

w\$switchTo makes the window active.

w\$maximize maximizes the window. Currently it sets it to a fixed size.

w\$getSize returns the size of the window, in a list with elementh width and height, both integers.

w\$setSize sets the size of the window.

w\$getPosition returns the position of the window on the screen. Phantom.js being headless, it always returns list(x = 0, y = 0), and it is included to have a complete impelementation of the WebDriver standard.

w\$setPosition(x, y) sets the position of the window on the screen. Phantom.js being headless, it has no effect, and it is included to have a complete implementation of the WebDriver standard.
