Grundgesetze.sty for ${ m Large T}_{ m E}X2e$ Documentation

Marcus Rossberg University of Connecticut marcus.rossberg@uconn.edu

Version v1.03 2021/04/26

grundgesetze.sty is a IAT_EX2e package for typesetting formulae in Gottlob Frege's begriffsschrift [concept-script] in the style of his Grundgesetze der Arithmetik (Jena 1893/1903). The package was developed for the 2013 English edition.¹ The package is based on Josh Parsons's begriff.sty which renders the formalism in the style of Frege's earlier work, Begriffsschrift (Halle a.S. 1879). It was amended by Richard Kimberly Heck, J.J. Green, Agustín Rayo, and Marcus Rossberg. Thanks to Philip Ebert and Sanford Shieh for testing and suggestions. Frege's defined function symbols are not rendered by this package, but by J.J. Green's fge.sty.

1 Options

At present the only package option is bguq, which causes the package to use the bguq font for an alternative universal quantifier (concavity), and this option accepts a value (corresponding to the size to be used, as in bguq=6; default is 5). The bguq font is required for this option. It is included in recent versions of the big T_FX distributions.

2 Basic Commands

GGhorizontal	The horizontal, —
\GGnot	The negation-stroke, τ
\GGconditional	Conditional-stroke: called as $GGconditional{p}{q} yields [q p]$
\GGquant	Concavity: called as \GGquant{\mathfrak a} gives .
\GGjudge	Judgement-stroke, -
\GGdef	Definition-stroke, $\ $ -
\GGbracket	Automatically scaling brackets, \GGbracket{\ldots} yields () (see exam-
	ples below)
\GGsqbracket	Analogous square brackets, []
	A complete list of commands and synonymns in the package can be found in
	Table 4, and the lengths parameterising the appearance of the output in Table 5.

 $^{^1\}mathrm{Gottlob}$ Frege: Basic Laws of Arithmetic. Translated and edited by Philip A. Ebert and Marcus Rossberg. Oxford 2013.

2.1 Examples

 \GGjudge \GGquant{\mathfrak a} \mathfrak a = \mathfrak a yields

 $\mid \mathfrak{a} = \mathfrak{a}$

• \GGjudge \GGnot \GGquant{\mathfrak F} \GGnot \GGquant{\mathfrak a} \mathfrak{Fa}

yields

• \GGjudge \GGconditional{(\GGhorizontal p)}{p} yields

 $\begin{bmatrix} p \\ (--p) \end{bmatrix}$

 \GGjudge \GGbracket{\GGconditional{p}{q}} = \GGbracket{\GGconditional{\GGnot q}{\GGnot p}}

yields

 $+ \left(\bigsqcup_{p}^{q} \right) = \left(\bigsqcup_{p}^{p} \right)$

There are further examples, including Frege's six basic laws of logic, available for download on http://www.frege.info/.

3 Advanced Typesetting

3.1 Left-alignment of terminal forumlae: \GGterm

Conditional-strokes, negation-strokes, and concavities that are embedded in conditionals can result in a ragged appearance of the formula:

• \GGjudge\GGconditional{p}{\GGconditional{q}{p}} yields:

$$\prod_{p}^{p}$$

• \GGjudge\GGconditional{Fa}

{\GGnot \GGquant{\mathfrak a} \GGnot F \mathfrak a}

yields:

 $\vdash_{Fa}^{\mathfrak{a}} F\mathfrak{a}$

In Frege's original work, the component formulae of conditionals are leftaligned. This can be achieved by marking "terminal formulae" using the command \GGterm{(math)}; the length \GGlinewidth specifies the distance of the terminal formula from the left end of the whole formula (typically, ' \downarrow '):

```
\setlength{\GGlinewidth}{9.2pt} \GGjudge
\GGconditional
      \{\GCterm{p}\}
      \{GGconditional(GGterm{q})\}
                        \{\GCterm{p}\}\}
yields:
                                        \prod_{q}^{p}
\setlength{\GGlinewidth}{25.2pt}
\GGjudge\GGconditional{\GGterm{Fa}}
                          {\GGnot \GGquant{\mathfrak a} \GGnot
                            GGterm{F \ a}
yields:
                                       \mathfrak{a}_{\mathsf{T}}F\mathfrak{a}
                                          -Fa
                negation-stroke
                                               4.4 \mathrm{pt}
                                       т
                conditional-stroke
                                               4.4 \mathrm{pt}
                concavity
                                                11.6pt
                judgement-stroke:
                   present
                                               add .4pt
                   not present
                                               subtract 2pt
```

Table 1: Lengths of embedded symbols

The correct values for \GGlinewidth for each formula can be determined by adding up the lengths of the embedded symbols, as given in Table 1, or by using a GUI that allows producing IAT_EX and XML code for *begriffsschrift* formulae by mouse-click. The GUI will calculate and output the correct values. It is available for download on http://www.frege.info/.

3.2 Adding horizontal lengths manually: \GGnonot, etc.

Readability is sometimes aided by moving, e.g., negations to the right end of the horizontal in a complex formula. For instance, Frege nearly always prefers the rendering displayed on the right in these types of formulae:

(a)
$$\begin{array}{c} f(a) \\ \hline a \\ f(a) \\ \hline f(a)$$

The right-hand formulae are produced by inserting commands for horizontals of the appropriate length directly at the position where the "space" should appear. The three right-hand formulae above are created thus, respectively:

```
(a) \GGGjudge \GGconditional

{\GGquant{\mathfrak a} \GGnot f(\mathfrak a)}
{\GGnoquant \GGnot f(a)}

(b) \GGjudge \GGconditional

{\GGquant{\mathfrak a}
\GGconditional{f(\mathfrak a)}{g(\mathfrak a)}}
{\GGconditional{f(a)}{g(a)}}

(c) \GGjudge \GGconditional

{\GGnonot \GGnot f(a)}
{\GGconditional{\GGnonot f(b)}{\GGnot a=b}}
```

4 Comparison and compatibility with *begriff.sty*

Josh Parsons's *begriff.sty*, on which *grundgesetze.sty* is based, is closer in appearance to Frege's formalism as it is presented in Frege's first book, *Begriffsschrift* (Halle a.S. 1879). The corresponding commands were given different names so that both packages can be used in the same $T_{\rm FX}$ document; see Table 2.

begriff.sty command	symbol	grundges symbol	etze.sty command
\BGcontent	-		\GGhorizontal
\BGnot	т	т	\GGnot
\BGconditional{p}{q}	$\left[\begin{array}{c} q \\ p \end{array} ight]$	$\lfloor rac{q}{p}$	\GGconditional{p}{q}
\BGquant{\mathfrak a}	_a_		\GGquant{\mathfrak a}
\BGassert	F,	ŀ	\GGjudge
\BGbracket{\ldots}	$\left(\left[\begin{array}{c} q\\p \end{array} ight)$	$\left(\left[\begin{array}{c} q \\ p \end{array} \right) \right)$	\GGbracket{\ldots}

Table 2: Compatibility with *begriff.sty*

Also note the differences in alignment between **\BGbracket** and **\GGbracket** as shown in Table 3

4.1 Conversion of a *begriff.sty* document into a *grundge-setze.sty* document

A straightforward way to convert the a LATEX document that uses *begriff.sty* into one that uses *grundgesetze.sty* without manually exchanging the commands is to find and replace "\BG" by "\GG". Synonyms have been added to *grundgesetze.sty* to allow the use of all *begriff.sty* commands "translated" in this way (see Table 4).

command	symbol	synonym / comment
\GGterm{\ldots}		(marks terminal formula)
\GGhorizontal		\GGcontent
\GGjudge	ŀ	\GGassert
\GGjudgelong	<u> </u>	\GGjudgealone, \GGassertlong,
		\GGassertalone
$GGjudgevar{\langle length \rangle}$	<u> -</u>	$GGassertvar{\langle length \rangle}$ (variable horizontal length, here: 6pt)
\GGdef	╟	
\GGdeflong		\GGdefalone
$GGdefvar{\langle length \rangle}$	\parallel	(variable horizontal length, here: 6pt)
\GGnot	т	\GGneg
\GGnotalone	\top	(standalone negation-stroke)
\GGdnot	-TT-	(standalone double negation-stroke)
\GGconditional{p}{q}	$\left[\begin{array}{c} q \\ p \end{array} ight]$	
\GGquant{\mathfrak a}	Ŀ.	
\GGall{a}	_ů_	\GGquant{\mathfrak a}
\GGbracket{\ldots}	()	(automatically scaling brackets)
\GGsqbracket{\ldots}	[]	(ditto square brackets)
\GGnonot	-	horizontal of \GGnot length
\GGnoquant		horizontal of \GGquant length
\GGnoboth		horizontal of length: \GGnot plus
		\GGquant
\GGnonotalone		horizontal of \GGnotalone length
\GGnodnot		horizontal of \GGdnot length
\GGoddspace	—	horizontal of length: \GGquant minus
		\GGnot
\GGtinyspace	-	horizontal of length: \GGquant minus
		twice \GGnot)
\GGtiniestspace	-	horizontal of length: thrice \GGnot
		minus \GGquant

Table 3: **\BGbracket** and **\GGbracket** alignment

Table 4: All commands (and synonyms) defined by the package

5

length	default value	explanation
\GGthickness	0.4pt	thickness of horizontal and vertical lines
\GGquantthickness	$0.75 \times$ \GGthickness	thickness of the line of the quanti- fier "dish". Note that this value is unused if the bguq option has been selected
\beforelen	2.4pt	length of horizontal before quantifier, conditional, and negation
\GGafterlen	2pt	length of horizontal after quantifier, conditional, negation, judgement-, and definition-stroke
\GGspace	$3 \mathrm{pt}$	space between right end of horizontal and terminal formula
\GGlift	$2 \mathrm{pt}$	lift of horizontal from baseline
\GGlinewidth	(n/a)	total length from left end of formula (typically, '\GGjudge') and the be- ginning of the terminal formula (see $\S3.1$)

Table 5: Length parameters and their default values
