Options

Datatype: Microsatellite data [Brownian motion]
 Missing data: not included
 Random number seed: (from parmfile) 310705631
 Start parameters:

Theta values were generated RANDOM start value from U(min,msx)

M values were generated from the FST-calculation

Connection type matrix:
 where m = average (average over a group of Thetas or M,
 s = symmetric M, S = symmetric 4Nm, 0 = zero, and not estimated,
 * = free to vary, Thetas are on diagonal

Population	1	1
1 population_num	*	*
1 population_num	*	*

Order of parameters:
 1 Θ_1 <displayed>

Mutation rate among loci: Mutation rate is constant for all loci

Analysis strategy: Bayesian inference

Bayesian Analysis: Posterior distribution over all loci

Log-Probability of the data given the model (marginal likelihood)

Use this value for Bayes factor calculations:

$BF = \text{Exp}[\ln(\text{Prob}(D | \text{thisModel}) - \ln(\text{Prob}(D | \text{otherModel}))$

or as $LBF = 2(\ln(\text{Prob}(D | \text{thisModel}) - \ln(\text{Prob}(D | \text{otherModel}))$

shows the support for thisModel]

(1a, 1b and 2) is an approximation to the marginal likelihood, make sure the program run long enough!

(1a, 1b) and (2) should give a similar result, (2) is considered more

crude than (1), but (1) needs heating with several well-spaced chains,

(1b) is using a Bezier-curve to get better approximations for runs with low number
of heated chains
