Chapter 1

Functions

1.1 poly.factor – polynomial factorization

The factor module is for factorizations of integer coefficient univariate polynomials.

This module using following type:

polynomial :

`polynomial` is the polynomial generated by function `poly.uniutil.polynomial`.

1.1.1 brute_force_search – search factorization by brute force

```
brute_force_search(f: poly.uniutil.IntegerPolynomial, fp_factors:  
list, q: integer)  
→ [factors]
```

Find the factorization of `f` by searching a factor which is a product of some combination in `fp_factors`. The combination is searched by brute force.

The argument `fp_factors` is a list of `poly.uniutil.FinitePrimeFieldPolynomial`.

1.1.2 divisibility_test – divisibility test

```
divisibility_test(f: polynomial, g: polynomial) → bool
```

Return Boolean value whether `f` is divisible by `g` or not, for polynomials.

1.1.3 `minimum_absolute_injection` – send coefficients to minimum absolute representation

`minimum_absolute_injection(f: polynomial) → F`

Return an integer coefficient polynomial F by injection of a $\mathbf{Z}/p\mathbf{Z}$ coefficient polynomial f with sending each coefficient to minimum absolute representatives.

The coefficient ring of given polynomial f must be **IntegerResidueClassRing** or **FinitePrimeField**.

1.1.4 `padic_factorization` – p-adic factorization

`padic_factorization(f: polynomial) → p, factors`

Return a prime p and a p-adic factorization of given integer coefficient square-free polynomial f . The result **factors** have integer coefficients, injected from \mathbb{F}_p to its minimum absolute representation.

†The prime is chosen to be:

1. f is still squarefree mod p ,
2. the number of factors is not greater than with the successive prime.

The given polynomial f must be `poly.uniutil.IntegerPolynomial`.

1.1.5 `upper_bound_of_coefficient` – Landau-Mignotte bound of coefficients

`upper_bound_of_coefficient(f: polynomial) → long`

Compute Landau-Mignotte bound of coefficients of factors, whose degree is no greater than half of the given f .

The given polynomial f must have integer coefficients.

1.1.6 `zassenhaus` – squarefree integer polynomial factorization by Zassenhaus method

`zassenhaus(f: polynomial) → list of factors f`

Factor a squarefree integer coefficient polynomial f with Berlekamp-Zassenhaus method.

1.1.7 integerpolynomialfactorization – Integer polynomial factorization

integerpolynomialfactorization(*f*: *polynomial*) → *factor*

Factor an integer coefficient polynomial *f* with Berlekamp-Zassenhaus method.

factor output by the form of list of tuples that formed (*factor*, *index*).
